

Dolphin Integrated Navigation System

Dolphin is an integrated navigation and control system designed to meet the demanding needs and challenging environments of multi-vessel distributed operations such as ocean bottom cable and shallow water seismic operations. Dolphin delivers a unique combination of centralization, data management, advanced positioning techniques, and flexible configuration. The system not only improves the acquisition quality and the production management, but also reduces the cost of operation.

Features and Benefits

- ★ Centralized remote control
- ★ Robust deployment navigation
- ★ Kalman filter navigation
- ★ Synchronized seismic acquisition
- ★ Real-time QC control
- ★ Navigation data logging in industry standard formats
